FOR IMMEDIATE RELEASE
09/19/06

TECHSPANSION RELEASES VISUALHUB 1.1.3

The first third-party video converter to create 640x480 H.264 files for iPod!

VisualHub has struck a chord with all types of Mac fans – from home users, to universities and even video production houses – with its simple, yet powerful interface and its incredible compatibility with the multitude of video formats in use today.

On September 12th, Apple announced an update for 5G iPods, providing higher-resolution H.264 videos. Unfortunately, this was limited to purchased videos and videos converted by the QuickTime frameworks — third-party encoders were left out.

Less than one week after the announcement of the higher resolution update for the 5G iPod, Techspanion has unlocked this functionality for its users of VisualHub...at speeds up to 40% faster than QuickTime/iTunes!

Other features exclusive to VisualHub's high-res H.264 iPod mode are:

1. Higher quality at the same bitrate.
2. Variable Quality and Bitrate.
3. Selectable Image Size - Even convert anamorphically for widescreen HD playback.
4. Two-Pass encoding for even better image quality.

VisualHub 1.1.3 is available immediately as a free trial from <http://visualhub.net>, priced at \$23.32 USD. It is a free upgrade for all registered users...although they are certainly welcome to pay again if they'd like.
